                                                                                                                                                                                                                                                                                                     a
                                                                                                                                                                                                                                                                                                                                                    The present sequence encodes human activation-induced cytidine deaminase
(AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and
has cytidine activity similar to APOBEC-1. AID has antiallergic,
antianaemic, antiasthmatic, ophthalmological, anti-HIV and
dermatological activities, and can be used in gene therapp. AID
polymoteotides are useful in methods for identifying drugs for the
treatment of B cell associated immune system disorders, immunodeficiency
diseases and allergies, such as immunoplobulin A (1gA) deficiency
disease, IgA nephritis, gamma-globulinaemia, atopic dermatitis, allergic
colitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen
colitis, asthma, food allergy, drug allergy, rallergic rhinitis, Rosen
immunodeficiency disease, ataxia telahgiectasia, common variable
colitis and IgG subclass selection disorder. The DNA sequences
IgE disorder, and IgG subclass selection disorder. The DNA sequences
cencoding AID may be used for gene therapy and the antibodies to the AID

```
The present sequence encodes mouse activation-induced cytidine deaminase (AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and has cytidine activity similar to APOBEC-1. AID has antiallargic, and entianaemic, antiasthmatic, ophthalmological, anti-HTV and dermatological activities, and can be used in gene therapy. AID conjuncieotides are useful in methods for identifying drugs for the treatment of B cell associated immune system disorders, immunodeficiency diseases and allergies, such as immunoglobulin A (IgA) deficiency disease, IgA nephritis, gamma-globulinaemia, atopic dermatitis, allergic colitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen disease, DiGeorge disease, ataxia telangiectasia, common variable immunodeficiency disease, AIDS (auto immunodeficiency syndrome), elevated IGE disorder, and IgG subclass selection disorder. The DNA sequences encoding AID may be used for gene therapy and the antibodies to the AID protein may be used for gene therapy and the antibodies to the AID
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 332

The present invention describes an activation-induced cytidine deaminase (AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and has cytidine activity similar to APOBEC-1. AID has antiallergic, antiasthmatic, ophthalmological, antiallergic, and embological, anti-HIV and dermatological activities, and can be used in gene therapy. AID polynucleotides are useful in methods for identifying drugs for the treatment of B cell associated immunos system disorders, immunodeficiency diseases and allergies, such as immunoglobulin A (IgA) deficiency disease, IgA nephritis, gamma-globulinaemia, atopic dermatitis, allergic colitis, asthma, food allergy, drug allergy, allergy, allergy allergy, allergy allergy, drug allergy, allergy, allergy chinitis, Rosen immunodeficiency disease, MIC (man)or histocompatibility class) class if deficiency disease, AIDS (auto immunodeficiency syndrome), elevated IgE disorder, and IgG subclass selection disorder. The DNA sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes an activation-induced cytidine deaminase (AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and has cytidine activity similar to APOBEC-1. AID has antiallergic, antianaemic, antiasthmatic, ophthalmological, anti-HIV and carmatological activities, and can be used in gene therapy. AID polynucleotides are useful in methods for identifying drugs for the treatment of B cell associated immune system disorders, immunodeficiency diseases and allergies, such as immunoglobulin A (IgA) deficiency disease, IgA nephritis, gamma-globulinaemia, atopic dermatitis, allergic colitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen disease, DiGeorge disease, ataxia telangiectasia, common variable immunodeficiency disease, AIDS (auto immunodeficiency syndrome), elevated in deficiency disease, AIDS (auto immunodeficiency syndrome), elevated in deficiency and IgG subclass selection disorder. The DNA sequences

II deficiency disease, AIDS (auto immunodeficiency syndrome), elevated 1gE disorder, and IgG subclass selection disorder. The DNA sequences encoding AID may be used for gene therapy and the antibodies to the AID protein may be used for diagnosis and treatment of these disorders. The present sequence represents the exon 3 genomic DNA sequence of human AID.

This is the polynucleotide sequence of the clone 1p547_4, which was isolated from a human fetal brain cDNA library using methods which are selective for cDNAs encoding secreted proteins, or by identification as a secreted or transmembrane protein on the basis of computer analysis of the amino acid sequence of the encoded protein.

The PNS and proteins of the invention are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, hemostatic immune stimulating (e.g. as vaccines) or suppressing activity, hemostatic activity, chinhibin activity, chemotactic/chemokinetic activity, and thrombolytic activity, chemotactic/chemokinetic activity, and thunor inhibition activity. The PNS are also stated to be useful for gene therapy. Other activities include inhibiting the growth, infection or inhibition activity. The PNS are also stated to be useful for gene therapy. Other activities include inhibiting the growth, infection or inhibition activity. The PNS are also stated to be useful for gene therapy. Other activities include inhibiting the growth, infection of bodily characteristics such as, eg. weight, color, skin, etc., effecting biorhythms or circadian cycles; enhancing fertility; treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                758

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel human secreted proteins, the nucleic acids encoding them. The protein may exhibit cytokine, cell proliferation or cell differentiation activity or may induce production of other cytokines in certain cell populations and may exhibit immune stimulating or immune suppressing activity, which is useful for the treatment of immunodeficency (SCID), autoimmune disorders e.g. severe combined systemic lupus erythematosus, rheumatoid arthritis, autoimmune pulmonary inflammation. The proteins are also useful in the treatment of diseases and disorders e.g. multiple sclerosis, andiammation. The proteins are also useful in the treatment of diseases and disorders including tissue, skin and organ transplantation and in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated polynucleotides (ABA90876-ABA90968 and ABA90980) and encoded proteins (ABB55698-ABB55800), especially by a polynucleotides SEQ ID NO 1 (ABA90876) and SEQ ID NO 19 (ABA90885) and proteins SEQ ID NO 2 (ABB55698) and SEQ ID NO 20 (ABB55707) contained in clones bd306-7 and yb8-1 respectively and the clones bd306-7 and yb8-1 are deposited with the American Type Culture Collection (ATCC) with are deposited with the American Type Culture Collection (ATCC) with coreasion number 98599. The polynucleotides and encoded polypeptides have cytostatic, anti-inflammatory, immunomodulator, vulnerary, neuroprotective, activiti, inhibin, chemotactic, haemostatic, thrombolytic and anti-inflammatory activity and acting as cytokine modulators,
                                              Human; clone bd306-7; clone yb8-1; ATCC number 98599; gene therapy; limmune disorder; bacterial infection; fungal infection; cancer; tumour; autoimnune disorder; systemic lupus erythematosus; wound; ulcer; inhibin; osteoporosis; osteoarthritis; nervous system disorder; neuropathy; Alzheimer's disease; Parkinson's disease; Huntington's disease; activin; haemophila, cardiac infarction; stroke; sepsis; arthritis; vulnerary; ischaemia-reperfusion injury; inflammatory bowel disease; chemotactic; crohn's disease; cytostatic; anti-inflammatory; immunomodulator; neuroprotective; haemostatic; thrombolytic; anti-inflammatory; ss.
